Mr. Michael Widener

7500 Woodmont Avenue, Apt. 218

Bethesda, Maryland 20814

Dear Mr. Widener:

Enclosed is the report of your test results. I apologize for the delay in getting you these results. As you will see, I wrote one report for school (Neuropsychological Evaluation) and the Personality Assessment is for you to bring with you if you meet with a neurologist, therapist, or psychiatrist.

You performed very well on most of the tests administered to you including the aptitude test, which placed you in the superior range of general intelligence. Some strengths and weaknesses were noted. Your memory test scores were average, which would be normal compared to others your age but slightly low compared to how high your Full Scale IQ was. For this reason, I would recommend that you talk to a neurologist regarding your memory difficulties. It is possible that these problems are primarily related to mild depression and anxiety, which was detected on the personality instruments. You meet criteria for a Math Learning Disability based on the pattern of test scores and the description of your history.

You do not meet criteria for ADHD. It is my estimation that the attention and concentration problems that you describe are more related to emotional factors. I would recommend psychotherapy to help with stress management. I have listed the names of psychiatrists who see therapy patients and who can also talk with you about whether a medication may help with the anxiety or depression symptoms.

At this time, I would recommend that following:

- Bring the neuropsychological report to American University to determine which accommodations can be put in place for you, especially regarding math.

Try to schedule an appointment with one of the neurologists below to assess whether or not
